

# Design of Boost Inductor

Required Inductance,  $L = 0.9\text{mH}$

Required Specifications are:

$I_{\text{peak}} = 13.94\text{A}$ ;  $I_{\text{rms}} = 5.6\text{A}$

Winding factor,  $K_w = 0.6$

Max Flux density,  $B_m = (\text{Ferrite core})$

Current density,  $J = 3\text{A/mm}^2$  (Copper)

**Using Area product method for Design:**

**Area Product**

$$A_p = A_c \cdot A_w = \frac{L \times I_{\text{peak}} \times I_{\text{rms}}}{J \times K_w \times B_m}, A_c = \text{Core Area}$$
$$, A_w = \text{Window Area}$$

Substituting values we get:

$$A_p = 19.516 \times 10^4 \text{ mm}^2$$

We have selected EE65/32/26 based on area product from the standard core table available

Specifications of EE 65/32/26 are:

$$A_c = 532 \text{ mm}^2$$

**No. of Turns ,**

$$N = \frac{L \times I_m}{A_c \times B_m}$$

Substituting values we get :

$$N = 117.9 \approx 118 \text{ turns}$$

**Gauge of Wire ,**

$$\text{Gauge , } \alpha = \frac{I}{J} = \frac{6}{3} = 2 \text{ mm}^2$$

SWG based on value of 2 mm<sup>2</sup> is SWG 16

**Air Gap Length ,**

$$l_g = \frac{\mu_0 \times N^2 \times A_c}{L} = 5\text{mm}$$
